Sprint 3 Burndown Chart Explain:
The burndown char looks similar to Sprint 2. We can see that our sprint started on July 8th. Also, we can see that most of the tasks were completed by the end of the sprint. This is because it took 2 weeks for each team member to complete a user story. Overall, we managed to complete the tasks without postponing any tasks to the next sprint. We completed the work evenly throughout the sprint, the burndown chart shows that we completed most of the work on July 15, due to updating our progress on Jira after it was fully completed.
Compared to the previous sprint, the velocity of the burndown chart was very similar, as a user story is not considered finished until all subtasks are finished, so most user stories were completed near the end. We also expect to have similar chart in next sprint.
